

Do you want speed  
or security? Get both.

Fast security on a single, unified platform

Website security is no longer an issue of concern for security personnel only, it requires everyone to be vigilant. Websites have now become the leading attack of choice, and such attacks have shifted from the perimeter layer to the more accessible web application layer that people use everyday to shop. Bank, manage healthcare, pay bills, book travel and apply to college. The consequence for companies who do not adequately protect and secure their websites are clear: loss of data, malware infection, loss of consumer confidence, and failure to meet regulatory requirements. No company can afford the loss of reputation resulted from a website attack.

There is no pre-existing infrastructure of independent software vendors pushing-out standard patches for commercial products, every website is unique custom code. And, even more unique to websites is that they are – by design – open and available to the public; and, therefore, to hackers. With 9 out of 10 websites possessing serious vulnerabilities, it's best to know what issues exist before they can be exploited. Thus the need for regular web security scanning on your sites.
